

# Tree Cover Status & Change

## FOR NEWPORT NEWS, VA 2014-2021

**40%**

**Total percent** of land with Tree Cover

**\$14.2 million**

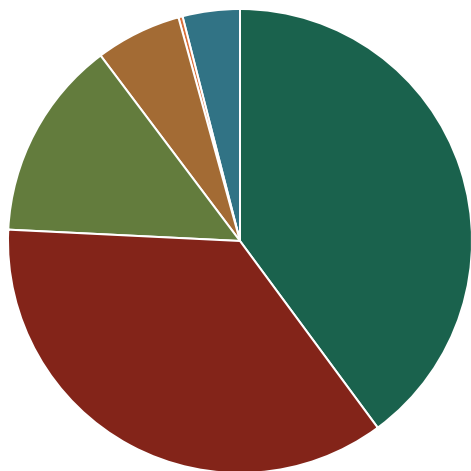

**Annual benefits** provided by Tree Cover (in reduced air pollution, stormwater, & carbon dioxide)

**-477 Acres**

**Net loss** of Tree Cover on developed lands, 2014 to 2021

### What is the land use/land cover breakdown in your community?

**42,351 ACRES OF LAND AREA**  
IN NEWPORT NEWS

### Where does tree cover occur in your community?

**57%**  
is in forest  
(9,583 acres)

**10%**  
is over impervious  
(1,609 acres)

**20%**  
is over turf grass  
(3,388 acres)

**13%**  
is other tree cover  
(2,273 acres)

### What are some benefits of tree cover in your community?

**Total Air Pollution Removal Value**  
**1.4 million lbs** removed annually  
**\$1.5 million** saved annually

Total air pollution removal includes CO, NO<sub>2</sub>, O<sub>3</sub>, SO<sub>2</sub>, and Particulate Matter (PM2.5, PM10).

**Gallons of Reduced Stormwater Runoff Value**  
**292.7 million gallons** reduced annually  
**\$2.6 million** saved annually

**Carbon Sequestered Value**  
**21,000 tons** removed annually  
**\$10.1 million** saved annually

Calculated based on 2021 tree cover data using: [landscape.itreetools.org](https://landscape.itreetools.org)

**40% Tree Cover<sup>1</sup>**  
16,854 acres

**36% Impervious**  
15,198 acres

**14% Turf Grass**  
5,880 acres

**6% Other<sup>2</sup>**  
2,618 acres

**0.29% Agriculture**  
124 acres

**4% Non-Forested Wetlands**  
1,677 acres

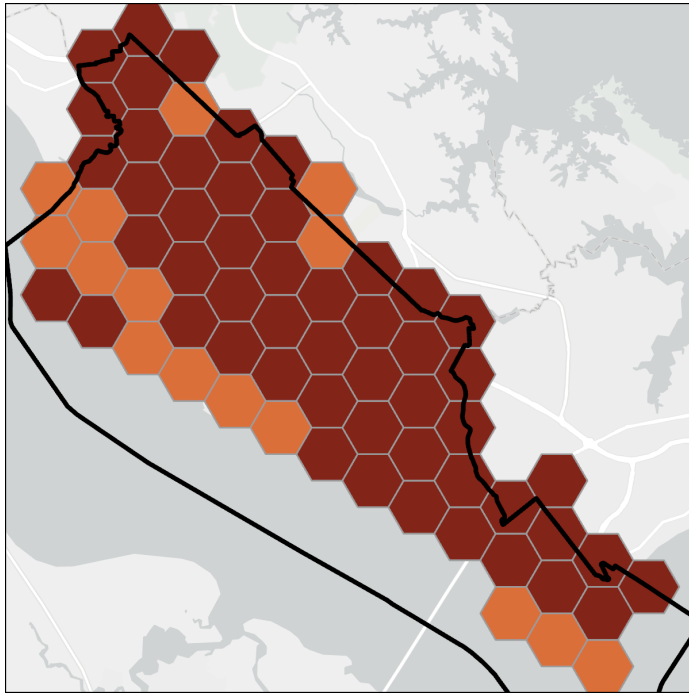

1. Tree cover includes all trees occurring on all land uses, such as individual trees found over turf, impervious, agricultural, wetlands, or other lands. It also includes areas of "forest," defined in this dataset as patches of tree cover 1 acre or greater, with a minimum patch width of 36 meters.
2. Other includes a mixture of non-treed land uses not captured in the main pie chart categories. See the *Data Guide* for detailed definitions of "other" and all the land use categories as well as accuracy statistics.

Land use/land cover statistics were generated based on 2021 imagery using the 2024 edition of the [Chesapeake Bay Land Use and Land Cover Database](#).

# How is tree cover changing on developed and developing lands?

■ > 1 Acres Net Tree Cover loss  
 ■ Minimal Tree Cover Change (± 1 Acres)  
 ■ > 1 Acres Net Tree Cover gain

\*Hexagons that are >90% water are not shown on the map.

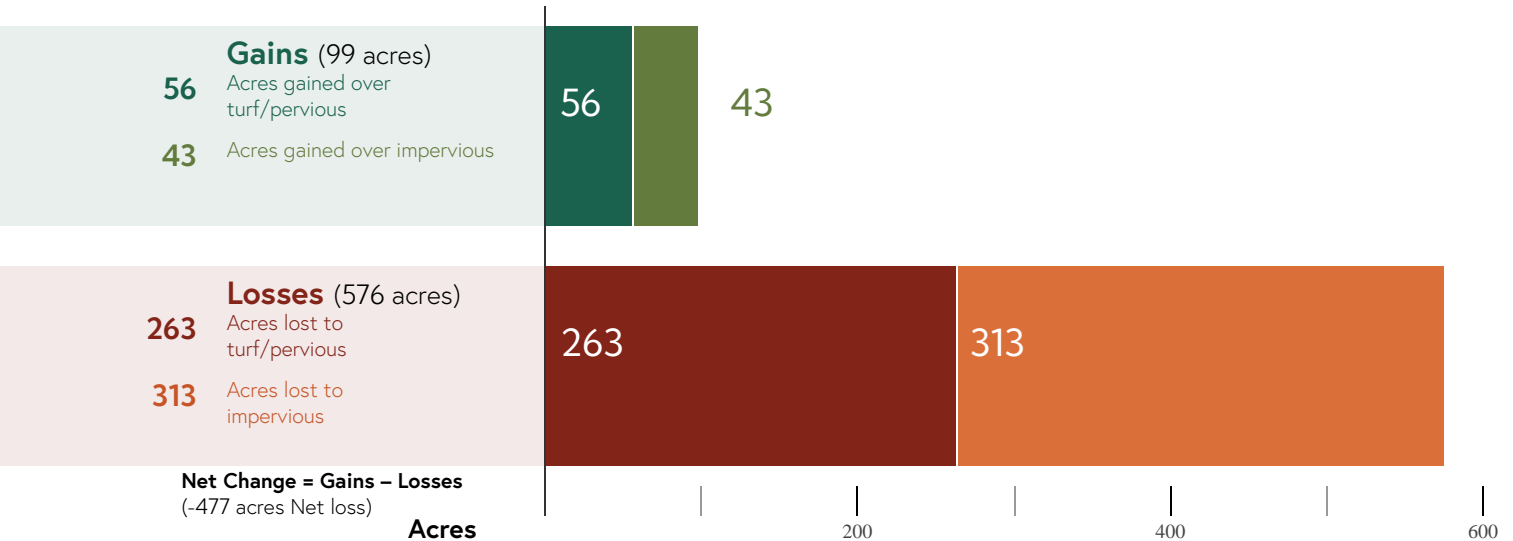

Understanding how your tree cover changes over time can inform the sustainable management of forests and community trees. The map to the left shows where your community has lost and gained tree cover from 2014 to 2021, focusing on land that is already or newly developed.

Tree cover can be lost quickly due to human activities (e.g., construction) or natural events (e.g., severe weather).

Tree cover can be gradually increased through tree planting and natural regrowth, but these gains may take 10-15 years to be detected in high resolution imagery.

Since mature, healthy trees provide significantly greater community benefits than newly planted trees, it is important to both preserve existing tree cover and seek opportunities to grow new trees and forests. Local land use planning, ordinances, and tree programs play a critical role!
